Grisham Vazirani

Stability Report

1. Strategy Pearson Correlations

This section of the stability report analyzes the metric stability of the Bollinger Bands Mean Reversion strategy, Simple Momentum Strategy, and Opening Gap Strategy, as defined in the Backtest Report by Grisham Vazirani. Firstly, we split the data for all 19 currencies into train and test groups. Then run every parameter combination for each strategy. The combinations and results are displayed below, with most parameters in the tables on the following three pages and the full tables in the appendix section of the report.

1. Bollinger Bands:
    a. n from 0-200, increments of 10
    b. entryZ from 0 - 3.5, increments of 0.5
    c. exitZ from 0 - 2.0, increments of 0.5
2. Simple Momentum:
    a. n in [1, 5, 10, 25, 60, 120, 250, 300, 350]
    b. holdDays in [1, 5, 10, 25, 60, 120, 250, 300, 350]
3. RSI:
    a. window from 2 - 22, increments of 2
    b. sl from 1 - 10, increments of 1
    c. tp from 1-10, increments of 1
4. Opening Gap:
    a. entryZ from 0 - 2.0, increments 0.5
    b. n1 from 50 - 500, increments of 50
    c. n2 from 10-200, increments of 10

Figure 4. Metric Correlations Across Applicable Currencies for Opening Gap Strategy

First it is important to note the difference in the table for the Opening Gap Strategy. Given the nature of the strategy, there were currencies where no trades were made at all during the test periods. There were also a number of currency markets where a large number of the correlation of the metrics were unreportable for some reason or the other. Those currencies were all removed from the report. Secondly, most of the test strategy sharpe ratios were 0, thus we are not reporting correlations for any of the ratios reported for other currencies.

2. Conclusions

Next we make note of some important correlations when analyzing both the statistics displayed above and the full statistics below in the appendix. We notice high correlations in annual return volatility through all strategies, especially Bollinger Bands mean reversion and simple momentum, where average correlation for annual return volatility across all markets is above 0.9. This is the strongest correlation we've found out of all of the metrics.

The number of trades made also has a high correlation across all markets and all strategies, however this is quite intuitive and not very informative to us as traders.

Return correlations across all markets for simple momentum and RSI are quite high as well. This is very useful to us since we can expect a decently high predictive power of returns across these markets when using these two strategies. It is important to note that since the predictor here is in sample returns it has a very high correlation with in sample returns and thus might not be what we're looking for.
